

## Data visualization - 03 - lines

Steve Simon

6/23/2019

## Notes about this talk

- This slide should not to be included in the final presentation
- 01-points MUST come before
- 02-bars could come before or after

To prepare for this section

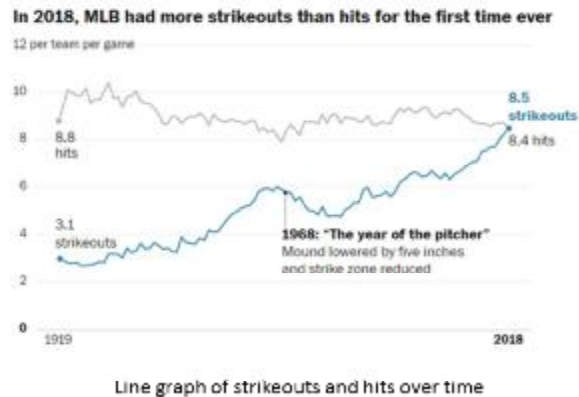

((Download the Titanic data set))

Python code

R code

Tableau steps

## Group exercise (1 of 2)

This is one of two graphs. It was published in

Popvich, N., Fountain, H., & Pearce, A. (2017, September 22). We Charted Arctic Sea Ice for Nearly Every Day Since 1979. You'll See a Trend. - The New York Times. The New York Times. Retrieved from <https://www.nytimes.com/interactive/2017/09/22/climate/arctic-sea-ice-shrinking-trend-watch.html>

Split into pairs. Review the article briefly (about 5 minutes) and look at the graph. Explain to your partner what the graph is trying to show. Your partner will get a different graph and do the same thing with you listening this time.

## Group exercise (2 of 2)

((Find second news article and image))

## More theory – The gestalt of graphics

- How do you draw someone's eye to quickly make certain associations?
- These ideas drawn from the Bergen and Iverson workshop.

A block of points - no emphasis

Color emphasizes rows

Shape emphasizes columns

Double up for stronger emphasis

Connectedness emphasizes rows

Proximity emphasize columns

Enclosure for emphasis, eight  
special points

## Continuity

((Show example of sloping text))

## Changing your emphasis

((Recreate example from slides 47-50 of Bergen and Iverson))

## Aesthetics for lines

- Location
- Size
- Shape (not what you think it is!)
- Color

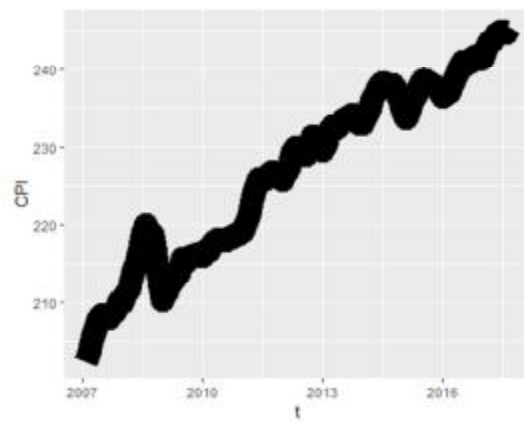

A line could mean a straight line or a curved line, a single line segment, a connected series of line segments or a polygon. It's a pretty complex thing, but generally a line represents a two dimensional relationship.

You can vary the size, shape, and color of a line. Shape is not what you think it is.

## Show different types and locations of lines

((Show a curved line, a straight line, a line segment, a series of line segments, and a polygon.))

## Size

## Shape

## On your own

- change the line to a dashed line.
- Make the width equal to 3
- Make the color green

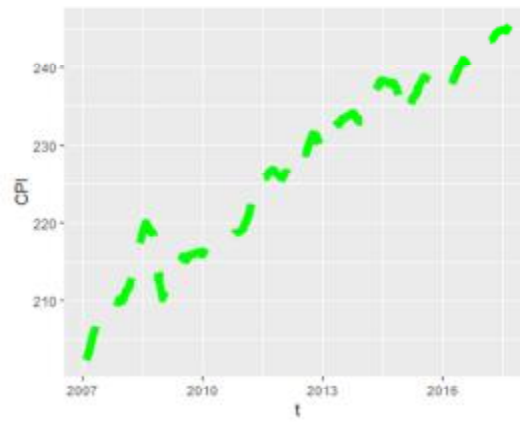

## Wait before showing

((Python code))

```
# R code  
ggplot(cpi, aes(x=t, y=CPI)) +  
  geom_line(size=3, linetype="dashed",  
            color="green")
```

((Tableau steps))

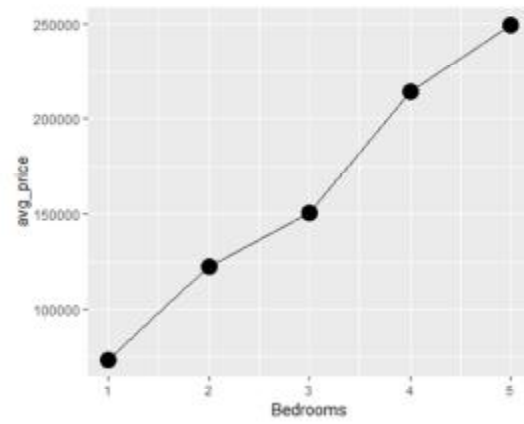

What your visualization might look like

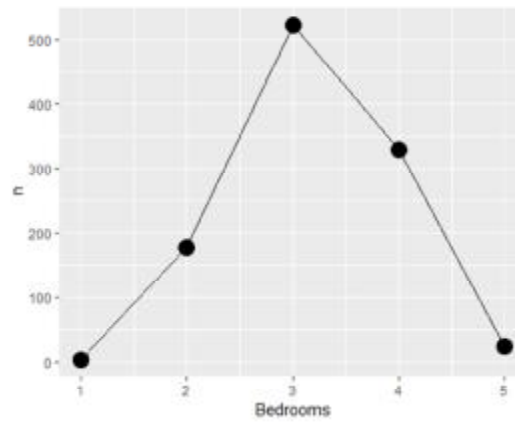

### Lines as summary statistics

### Lines as averages

## Lines as counts

## On your own

- Draw a line graph showing the relationship between the number of bathrooms and price.

Wait before showing

((Add code here))

What your visualization might look  
like

((Add visualization here))

## Boxplots

((Draw example and ask students to do a similar example))

## Trend lines (linear)

## Trend lines (spline)

### Trend lines (spline), not so smooth

## On your own

- Fit a linear trend line looking at Living.Area versus Price.
- Fit a smooth curve

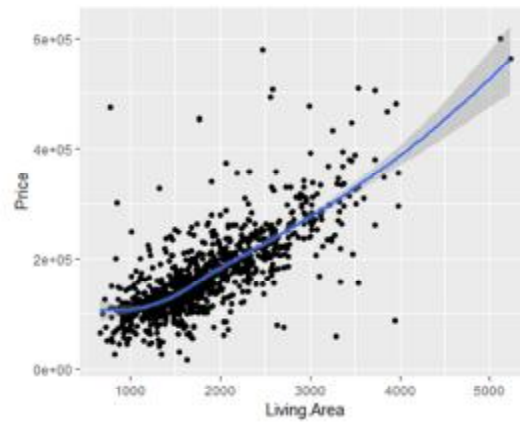

Wait before showing

What your visualization might look like

What your visualization might look like

## Trend lines (logistic)

((Need a different data set here. Titanic??))

## Helpful tips

((Add three or four slides here. Maybe talk about opacity.))

## Group exercise

- Review the following visualization in your group.
  - Summarize what aesthetics (location, size, shape, color) appear in the graph
  - What variables map to each aesthetic?

((Find new images or use the ones from earlier))

## Summary (1 of 2)

- Gestalt principles
  - ((List here))
- Aesthetics for lines
  - Size, Shape, Color
- Lines as summary statistics
  - One number summary (mean, total, count, percent)
  - Two number summary (error bars)
  - Five number summary (boxplots)

## Summary (2 of 2)

- Trend lines (linear, logistic, spline)
- Helpful tips
  - ((List here))
